## 2 Brief Description

Konstantinos Oikonomou (Ph.D., M.Sc., DIC, MEng) is a full professor at the Department of Informatics of the Faculty of Information Science and Informatics of the Ionian University in the field of “Computer Networks.” He has served as the Dean of the same faculty<sup>1</sup> from December 2017 to August 2021 and Head of the same department between May to October 2017.

He has authored in total 123 scientific publications (p. 39) and 115 correspond to refereed publications: 41 published in refereed journals and 74 in refereed conferences.<sup>2</sup> Currently, there are 972 cross-references to his work and the index metrics are h-index 16, g-index 26 and i10-index 26.<sup>3</sup>

He has received the best paper award for paper “Player Assignment in MEC Gaming for Social Interactivity and Server Provisioning Optimization” from 26th IEEE Symposium on Computers and Communications (ISCC 2021) and for paper “Power Efficiency Analysis for Topology-Unaware TDMA MAC Policies in Ad-Hoc Networks” from Proceedings of the 38th Annual Hawaii International Conference on System Sciences (HICSS 2005).

There are 7 Ph.D. graduations so far under his immediate supervision and he currently supervises 3 Ph.D. students that are in various levels of progress (p. 24). He is and has been heavily involved in 9 funded research and development projects and numerous others with smaller roles (p. 28). He has participated in the committees and the organization process of 9 international conferences (p. 27) and he has edited the proceedings of 3 of them.

He is currently a member of the editorial board of Computer Networks, Elsevier, and the recent Journal on Future and Evolving Technologies of the International Telecommunication Union (ITU). He has a reach teaching experience and has supervised 84 postgraduate and undergraduate these during undergraduate (35) and postgraduate (49) courses, respectively.

He has been employed as a research and development engineer by the hellenic industry of information and telecommunication Intracom S.A. for five years (1999-2005). He has served with the greek air force<sup>4</sup> for twelve months as telecom engineer. He has been employed as teaching staff at the Departments of Informatics of University of Ioannina kai Ionian University, respectively, in computer networks. He is fluent in Greek and English.

### 2.1 Occupation

He is a full Professor since April 2017 in the area of “Computer Networks” at the Department of Informatics of the Faculty of Information Science and Informatics of the Ionian University. He has held this faculty position as Lecturer and consequentially as Assistant and Associate Professor since April 2007. He has served as Head of Department of the Department of Informatics from May 2017 to October 2017, from May 2018 to May 2020 as Director of the M.Sc. postgraduate

---

<sup>1</sup>This particular faculty consists of the Department of Informatics and the Department of Archives, Library Science and Museology.

<sup>2</sup>There are 8 publications that have not been refereed correspond to various case, e.g., there were invited papers, abstracts, editing of conference volumes or project presentations (p. 47).

<sup>4</sup>Compulsory service.

course “Research Directions in Informatics” of the Department of Informatics of the Ionian University. From December 2017 to August 2021 he served as Dean of the Faculty of Information Science and Informatics of the Ionian University.

#### **OCCUPATION**

<b>April 2007 - present</b> <b>Ionian University</b> <b>Dept. of Informatics</b>	<b>Faculty member (Computer Networks)</b> Professor (January 2021 - today), Associate Professor (April 2017-January 2021), Assistant Professor (June 2011-April 2017), Lecturer (April 2007-June 2011)
<b>Dec. 2017 - August 2021</b> <b>Ionian University</b>	<b>Faculty of Information Science and Informatics</b> Dean
<b>May 2017-October 2017</b> <b>Ionian University</b>	<b>Department of Informatics</b> Head
<b>May 2018 - May 2020</b> <b>Dept. of Informatics</b> <b>Ionian University</b>	<b>M.Sc. Course “Research Directions in Informatics”</b> Director

## **2.2 Education**

He graduated from the Department of Computer Engineering and Informatics of the University of Patras (Greece) in July 1998<sup>5</sup> with an overall grade 8.23/10. His diploma thesis focused on video coding techniques to allow for efficient streaming over the network and was under Prof. Athanassios Skodras.

From September 1998 to September 1999 he studied at the M.Sc. postgraduate course in “Communications and Signal Processing” of Electrical & Electronics Engineering Department in Imperial College, London. During this course, the focus of his studies was in telecommunications and his postgraduate thesis, “Data Link Control Optimization in Multiple Access for Mobile Communications,” was supervised under Prof. Mustafa K. Gurcan.

From January 2000 to October 2004, his focus was on his Ph.D. studies<sup>6</sup> “Topology-Unaware TDMA MAC Policies for Ad Hoc Networks,” which took place at the Department of Informatics and Telecommunications at the National and Kapodistrian University of Athens under the supervision of Prof. Ioannis Stavrakakis. **EDUCATION**

<b>2000 - 2004</b> <b>National and Kapodistrian</b> <b>University of Athens</b>	<b>Ph.D. (Dept. of Informatics &amp; Telecommunications)</b> <i>Ph.D. Thesis Title:</i> Topology-Unaware TDMA MAC Policies for Ad Hoc Networks

**1993 - 1998**  
**University of Patras**

**MEng (Dept. of Computer Engineering & Informatics)**

5 years full time study at the Faculty of Engineering.

*Diploma Thesis Title:* Modern Video Coding Techniques

### 2.3 Relevant Work Experience

He has been working as a research and development engineer from December 1999 at the greek industry of informatics and telecommunications Intracom S.A., particularly at the General Research and Development Division, Development Programmes Department. For two years (2000-2002), his role was of researcher/engineer in the area of funded research projects in telecommunications and computer networks. One milestone of his carrier was his involvement in the development of a HiperLAN/2 prototype.<sup>7</sup> Next, he became the coordinator of such programs, and he was active in proposal submissions from European or national funds. He left Intracom S.A. in January 2005 to follow a research carrier.

He got a (not permanent) teaching position at the Department of Informatics of the University of Ioannina, teaching courses relevant to communications and computer networks. He was also working as a postdoc researcher at the Department of Informatics and Telecommunications of the National and Kapodistrian University of Athens, being involved in the research project Autonomic Network Architecture (ANA)<sup>8</sup>, a FET (Future Emerging Technologies) project of the European Committee.

#### WORK EXPERIENCE

**10/2004 - 6/2010**

**National and Kapodistrian University of Athens**

*Dept. of Informatics and Telecommunications*

Post-Doctoral Research in Autonomous Networks

**10/2006 - 4/2007**

**Ionian University - Dept. of Informatics**

Teaching two courses in the area of computer networks

**3/2006 - 8/2006**

**University of Ioannina - Dept. of Informatics**

Teaching two courses in the area of computer networks

**12/1999 - 1/2005**

**Intracom S.A. - R&D General Division**

Full time occupation as a research and development engineer

## 3 Main Research Activity

His research activity starts with the beginning of his Ph.D. studies<sup>9</sup> in 2000. His research work can be categorized as follows (each subsection corresponds to a main research category):

### 3.1 Medium Access Control (MAC) in Wireless Networks

#### 3.1.1 Topology-Independent Medium Access Control

#### 3.1.2 Synchronization and Fairness

---

<sup>7</sup>A Wireless LAN that at the time was considered as competitive to WiFi.

  - 3.8.5 Smart Agriculture
- 3.9 Various Research Topics (Security, Design, Social Networks, Education)

This combination of different areas in the wide scientific area of computer networks provided the opportunity to tackle various problems in an interdisciplinary manner, even though the research results required a significant effort to be achieved—the research activity of Prof. K. Oikonomou is described briefly in the sequel going through all publications per category.

### **3.1 Medium Access Control (MAC) in Wireless Networks**

Medium Access Control (MAC) is a challenging issue in wireless network environments. In cases of increased mobility and a large number of nodes, challenging performance issues are introduced. Analysis of performance is central in this area and the emphasis is on Time Division Multiple Access (TDMA).

### 3.1.1 Topology-Independent Medium Access Control

The main objective of Prof. K. Oikonomou's Ph.D. thesis<sup>10</sup> was the study of throughput of medium access control (MAC) policies for ad hoc networks. Various properties of Galois fields' polynomials were investigated that formed the basis for determining nodes' transmissions. The existing deterministic medium access control policies were investigated and it was shown that there is a large number of unused resources in the forms of time slots. Given this observation, the next step was introducing a MAC policy that could utilize the unused resources and therefore, a probabilistic MAC policy was introduced. This policy was analytically studied and the conditions throughput increment – when compared to the existing deterministic policies – were identified both for high traffic load<sup>11 12 13</sup> as well as for the general case.<sup>14 15</sup> In addition, the behavior of these MAC policies under conditions of controlled topology were investigated<sup>16 17</sup> and the conditions that need to be satisfied for having a throughput improvement by using such technology (e.g., smart antennas, power control). Finally, energy consumption consumption concepts were studied<sup>18 19</sup> (energy consumption issues are presented in more detail in 3.7, p. 16).

In the sequel, a new MAC policy was studied, an adaptive one based on the previously mentioned probabilistic policy and allows for different values of the access probability for every

---

<sup>10</sup>**Abstract**—In this PhD thesis, the medium access control problem was investigated using topology-unaware policies for ad-hoc networks. At the beginning, the Deterministic Policy was studied, which is based on properties of polynomials on Galois fields, allowing each node at least one successful transmission per frame. This policy suffers from low throughput, which is the reason for introducing the Probabilistic Policy, a policy that is capable of using unused time slots under the Deterministic Policy. Analytical results regarding system throughput maximization are derived and simulation results confirm them. At the sequel, both policies are examined under topology control and system throughput increment is observed, especially under the Probabilistic Policy; this confirms the ability of the latter policy to use the unused time slots under the Deterministic Policy. However, it is observed that under certain mobility conditions, the system throughput may be lower than the case where no topology control was used in the system. Power consumption is also important and it was shown that it is increased under the Probabilistic Policy in a per frame basis. On the other hand, the power consumption per successful transmission may be decreased, especially when time constrained data packets are considered.

node and transmission given the result (success or not) of the previous transmission.<sup>20,21</sup> A new MAC policy that attempts to reduce the unsuccessful transmissions by two-hop knowledge has also been proposed and its various advantages have been studied.<sup>22</sup>

### 3.1.2 Synchronization and Fairness

Medium access control in ad hoc network environments employing Time Division Multiple Access (TDMA) mechanisms introduces specific challenges like fairness and synchronization.

Fairness along with throughput has been analytically studied using simulations for the previously mentioned medium access control protocols.<sup>23</sup> A distributed mechanism to alter the probability access was proposed such that to keep at high value an also distributed fairness metric.

A distributed synchronization protocol was also studied considering experimentation in a low-cost system to highlight its practical significance.<sup>24,25</sup>

The employment of topology-unaware policies have been revisited recently considering vehicular network environments.<sup>26</sup> It was shown that safety applications that require reduced time delays could be achieved when utilizing different subframes depending on the automobiles' directions.<sup>27</sup>

### 3.1.3 Dual-mode Operation

A unified framework for studying ad hoc networks was also presented<sup>28</sup> helping to understand and analyze various concepts like quality of service (QoS) of the prototype wireless LAN net-

work HiperLAN/2<sup>29,30</sup> and particularly its transient behavior<sup>31</sup>. Working with this system and particularly with its dual operation in both 5 and 60 GHz<sup>32,33</sup> was carried<sup>34,35</sup> both analytical simulation models<sup>36</sup>. It was shown that this dual mode<sup>37</sup> is efficient and results in system capacity increment<sup>38</sup> under low mobility and high traffic load conditions among nearby nodes.

## 3.2 Scalable and Distributed Facility Location

The facility location problem is a classical one with various forms, the most well-known being the  $k$ -median problem when the number of facilities is known ( $k$ ) and the UFL (uncapacitated facility location) problem when both the number and the location of the facilities need to be optimized given that there is a cost for their maintenance. The solution of such problems answers many modern networking problems like placing a server, a virtual machine, or a virtual network function in a network environment that can also be a cloud or a fog computing environment. In the general case, these problems are NP-hard and require global knowledge of the network parameters to be solved. Even though there are approximation approaches that reduce the complexity, the global knowledge requirement still remains. However, this is not a realistic approach in modern network environments that are inherently dynamic (frequent topology changes, diverse user demands, etc.). Therefore, the traditional centralized approaches are not suitable since they require the continuous accumulation of network data that change and may become obsolete before being processed. Eventually, these are not scalable approaches.

### 3.2.1 Exploitation of Strictly Local Information

Strictly local information corresponds to information that is available to an individual node. In order to tackle the previously mentioned scalability problem, the various mechanisms that decide

on gradually better locations (in terms of the overall cost) for the facility and adapt automatically to dynamic network changes were studied. Even though they may not always conclude on the optimal location (non-realistic in any case in highly dynamic environments where the optimal location continuously changes), they allow for overall cost reduction for every movement of the facility compared to the previous location. Under this light, the first attempt was service migration<sup>39</sup> and it was analytically shown that moving a facility between two neighbor nodes in order to reduce the overall cost is possible by exploiting information that is locally available at the node hosting the facility. In particular, it was shown that it is enough to have knowledge of the aggregate traffic load arriving at the node that hosts the facility to decide the particular neighbor node that the facility should move or not reduce the overall cost. In this light, a migration policy was proposed relying on strictly local information. As it was analytically shown, this mechanism can move the facility until the optimal location (i.e., the solution of the 1-median problem) if the topology has a unique shortest path tree (e.g., tree topologies, topologies of different link weights etc.) This mechanism was further extended for the general case of topologies and more than one facilities and its properties were both analytically investigated and through simulations.<sup>40,41</sup> Even though the optimal location was proved only for the case of topologies of unique shortest path trees and one facility, it was shown that the proposed mechanisms have a satisfactory performance in the sense that they reduce the overall cost even with a small number of movements and respond immediately to changes of the network characteristics.

This particular approach was enhanced considering replicas of a facility<sup>42</sup> and the broader idea of changing the number of facilities in the network and migrating them was studied considering cloud computing environments<sup>43</sup> (further in 3.3.1, p. 9). The idea of migration a facility has been employed in various environments like peer-to-peer networks to achieve small cost content movement.<sup>44</sup> However, it is shown that it has a specific potential in cloud computing environments.

Energy consumption was studied considering facility location and more specifically employing migration<sup>45</sup> or as minimizing the overall consumed energy<sup>46</sup> (further on reducing energy consumption are presented in 3.7, p. 16).

### 3.2.2 Exploitation of Local Information

Local information refers to information about the network that can be acquired from its immediate neighborhood. Even though this is broader than strictly local information, it is still scalable to assume its knowledge for a few hops away from a node compared to the requirement for global knowledge.

Under this light, a new approach was proposed and studied<sup>47,48</sup> that allows for information gathering from all nodes a few hops away from the node that hosts the facility, thus creating a “ball” of radius equal to the number of hops. It is assumed that all network information within this ball is available to the node hosting the facility at the center of the ball. There is some cost for this information to become available and depends on the radius. Apart from this information, on those nodes at the “skin” of the ball is mapped the traffic that is originated outside the ball. Being aware of this information, a centralized solution of either the  $q$ -median or the UFL problem is executed within the ball. A new position for the sink may be derived as well as replicating or merging. This procedure is repeated and terminates in the case of a static environment while it responds to the dynamic changes in dynamic environments. A critical factor of this approach is the radius that is closely related to the desired scalability and performance properties. Large values of the radius are better in terms of performance (e.g., the algorithm converges faster since large parts of the network are known), but the requirement for knowledge of large parts of the network introduces the scalability problem already mentioned. However, as it was analytically shown, small radius values (1 or 2) allow for performance comparable to larger values for both synthetic and real topologies and traffic conditions, thus reducing the scalability problem since there is no need for a large radius.

### 3.3 Cloud/fog Computing Environments

Cloud computing and fog computing environments have been studied recently to support a multitude of applications and devices. The main challenges are the services’ location, network architecture, information dissemination, and new applications like exceptionally demanding cloud gaming.

#### 3.3.1 Facility Location in Cloud Computing Environments

The problem of facility location was considering assuming virtual machines as facilities in cloud computing environments.<sup>49</sup> In particular, the s-UFL (scalable-Uncapaciated Facility Location) policy was proposed that utilizes replication and merging mechanisms along with the migration policy for deriving the locations of the virtual machines in a cloud computing network. The efficiency of this policy is thoroughly investigated and it is proved that overall cost reduction is possible under certain conditions also investigated. The simplicity of the implementation is another advantage of the proposed policy.

In addition, the S-CORE (Scalable communication Cost Reduction) policy is proposed that aims for the overall network cost reduction in (cloud computing) environments by efficiently

utilizing the data centers' resources.<sup>50</sup><sup>51</sup> It is a scalable policy that moves virtual machines located at servers achieving overall cost reduction and reduced networking load. Simulation results have demonstrated a significant network cost reduction. These results ended up in a Ph.D. graduation.<sup>52</sup>

The problem of locating controllers in Software-Defined Network (SDN) environments has also been studied considering migration techniques.<sup>53</sup>

### 3.3.2 Architecture

Various architectures have been proposed for the efficient support of fog/cloud computing environments and applications. A first attempt took place considering services<sup>54</sup> and similar proposal were introduced for cloud gaming environments<sup>55</sup><sup>56</sup> and smart agriculture.<sup>57</sup> An interesting case is about fires and on-time alerts.<sup>58</sup>

### 3.3.3 Information Dissemination

Information dissemination is important in these environments due to the large number of devices, users and services that introduce challenging scalability problems. The considered approaches had inherit scalability properties like random walkers<sup>59</sup><sup>60</sup> (more in 3.4.3 at p. 13) and dominating

### 3.3.4 Cloud Gaming

Video games require a demanding network environment regarding bandwidth and jitter. This is one of the reasons that the research area of cloud/fog gaming has received increased research interest.<sup>63</sup> There are several problems like load balancing.<sup>64</sup>

The research interest in this area also involves the problem of the user's Quality of Experience (QoE). A facility location problem was studied and the particular locations concerning the user's satisfaction were considered.<sup>65</sup> A new policy, i.e., Rendering Service Allocation Policy-RSAP), was proposed.<sup>66</sup> This attempt ended up to a Ph.D. graduation.<sup>67</sup> The interest in the area continued in future work that also received the best paper award.<sup>68</sup> A strategic placement to minimize expenditure was also investigated.<sup>69</sup>

## 3.4 Information Dissemination in Computer Networks

The problem of information dissemination in large scale unstructured environments is studied and tackled using scalable policies in order to reduce the various disadvantages of the traditional flooding and random walkers approaches<sup>70</sup> The former, even though efficient concerning time that is upper bounded by the network's diameter, they are demanding concerning the number of sent messages (of the order of the network links). On the other hand, the number of sent messages under the random walker's mechanisms is reduced even though the time required to cover a particular network may be significantly large. Since it appears that the traditional flooding and random walkers mechanisms are complementary, one of the aims of the studies in this area was to bridge the gap among them by introducing novel and scalable approaches. Other approaches like dominating sets are also under consideration.

### 3.4.1 Probabilistic Flooding Studies and Applications

A first approach was the study of Probabilistic Flooding<sup>71,72</sup> and it was shown that with the appropriate configuration, it results in covering the entire network while reducing the number of sent messages significantly and slightly increasing termination time. For the analysis, random graphs were considered. It was shown that Probabilistic Flooding creates a network of certain characteristics that allowed for using results from random graph theory concerning the performance of Probabilistic Flooding. A robust version was also studied<sup>73</sup> that was later extended taking into account data from the NASA Langley Research Center (LaRC) POWER Project.<sup>74</sup> Application for a sensor network for the case of historical buildings was also considered.<sup>75</sup>

### 3.4.2 Probabilistic Flooding and Largest Eigenvalue/Principal Eigenvector

Probabilistic flooding was also studied borrowing tools from algebraic graph theory. Coverage was represented analytically by a polynomial and its roots corresponded to the particular value of the forwarding probability. At the same time, various results that have been already present in the literature were confirmed.<sup>76</sup> The extension of this approach provided for further analytical insights concerning the largest eigenvalues of the adjacency matrix and the eigenvector centrality of the nodes and an algorithm was proposed capable of approximating the value of the forwarding probability after showing that it converges.<sup>77</sup>

The extension of this research approach revealed interesting properties concerning the largest eigenvalue  $\lambda_1$  of the adjacency matrix and the principal eigenvector. Specifically, when Probabilistic Flooding is initiated by a node of a higher value of the corresponding elements of the principal eigenvector, then network coverage is faster. The most important result is that four over the value of the largest eigenvalue ( $\frac{4}{\lambda_1}$ ) corresponds to the particular value of the forwarding probability that is enough for full coverage.<sup>78</sup> This was part of the Ph.D. thesis.<sup>79</sup> Moreover, experiments took place in a realistic environment to demonstrate the effectiveness of this analysis.<sup>80</sup>

### 3.4.3 Random Walkers

Another considered approach was the employment of random walkers and replication mechanisms of random walkers either randomly or considering the underlying topology.<sup>81</sup><sup>82</sup><sup>83</sup> Another interesting approach refers to random walkers that perform directional jumps according to a two-state behavioral model.<sup>84</sup> Under this approach, revisiting certain network areas is avoided. A different approach concerning the analysis of coverage under a random walker<sup>85</sup> has allowed for studying the problem of multiple random walkers and the analytical results were confirmed by simulations.<sup>86</sup> This work was further extended assuming random walk replications in a network.<sup>87</sup> Random walkers were implemented in a low-cost system to demonstrate their advantages.<sup>88</sup> Part of this work was included in a Ph.D. Thesis.<sup>89</sup>

### 3.4.4 Dominating Sets

Connected dominating sets (CDS) were considered since such a subnetwork corresponds to the optimal information dissemination. It is a hard problem and the aim was to propose a scalable algorithm based on local information<sup>90</sup>. Part of this work was included in a Ph.D. Thesis.<sup>91</sup> The particular algorithm was also implemented in a low-cost system to highlight its scalability advantages.<sup>92</sup><sup>93</sup> This work was further extended and a new algorithm was proposed that used a

fixed number of messages (budget) to create the dominating set.<sup>94</sup>

Information dissemination or collection faces new challenges given UAV (Unmanned Aerial Vehicles). An initial study in this area evaluated the possibilities of using drones to collect data given a terrestrial wireless sensor network.<sup>95</sup> The extension of this work revealed a relation between basic symmetric schemes of the drone's route.<sup>96</sup> Studying a swarm of drones and experimenting with various paths was the next step.<sup>97</sup>

### 3.5 Virtual Reality Applications and Network Users

After a successful proposal regarding a funded development project<sup>98</sup> about the virtual representation of monuments and other important places of the Ionian Islands in virtual reality, new challenges were introduced. More specifically, the implemented virtual world is expected to be useful for the promotion of the area. However, the increased amount of information and the need for small latency to support multiple users introduce new networking challenges. In order to deal with these challenges, the starting point was the study of these environments concerning the provided quality of service and quality of experience.<sup>99</sup>

The various phases (requirements, design and implementation) required to create a large-scale virtual environment focusing on cultural inheritance are presented and studied.<sup>100</sup> As large scale virtual worlds may have a negative impact on the user's experience, suitable routes need to be selected in order to guide the user within a virtual world given its interests.<sup>101</sup> An algorithm for creating these routes was proposed inspired by routing in computer networks, in order to assist the virtual reality tour.<sup>102</sup> The special case of Corfu (the basis of the Ionian University) and how a new environment of promoting cultural inheritance using these type of approaches

### 3.6 Synchronization in Wireless Sensor Networks

Another research area that its starting point was a development project<sup>111</sup> was the development of a wireless sensor network that was to be installed in historical buildings for monitoring their structural behavior. There was a need for high accuracy, but the existing wireless technology could not provide for them as the wired could. The approach followed was to develop a sensor network of wired characteristics<sup>112</sup> and synchronization to take place not in real time but only when the sensed data were about to be processed.<sup>113</sup> This gave the idea for a new development project<sup>114</sup> and a measurements synchronization protocol was developed – instead of a clock synchronization one – that allows for sensed data to synchronize on a per hop basis as they arrive

at the sink node.<sup>115</sup><sup>116</sup> An application was also developed for the case of historical buildings.<sup>117</sup><sup>118</sup> Synchronization was also studied for agriculture environments (more in 3.8.5 at p. 20).<sup>119</sup>

### 3.7 Energy Consumption in Networks

The importance of energy consumption has already been mentioned for the case of medium access control, taking into account the fact that energy is unnecessarily consumed for obsolete data packets,<sup>120</sup><sup>121</sup> e.g., those that fail to satisfy certain time constraints. Peer-to-peer networks have also been studied to reduce energy consumption in wireless sensor networks<sup>122</sup> whereas transition phenomena have also been studied.<sup>123</sup> Another approach assumed energy harvesting issues.<sup>124</sup>

#### 3.7.1 Traffic Load

Energy consumption is related to load and in order to suppress the various misconceptions that appear in the literature, the problem of the randomness of the node positions was studied.<sup>125</sup><sup>126</sup> In particular, treating the traffic load of certain areas as an average value is not suitable since it neglects isolated nodes that do exist. Part of this work was included in a Ph.D. Thesis.<sup>127</sup>

### 3.7.2 Routing

Energy consumption is closely related to the routes that data packets follow and consequently, to the routing policy in the network.<sup>128</sup><sup>129</sup><sup>130</sup><sup>131</sup> Routing in wireless sensor networks was studied, allowing packets to dynamically choose different routes of less depleted batteries.<sup>132</sup><sup>133</sup><sup>134</sup> Part of this work was included in a Ph.D. Thesis.<sup>135</sup> Another approach by employing clustering mechanisms was also studied in order to reduce the burden of the network nodes.<sup>136</sup>

### 3.7.3 Sink Placement for Energy Consumption Minimization

Energy consumption is of critical importance in wireless sensor networks. In order to deal with this problem, at the first stage, the problem that was studied referred to the particular location of the sink node, thus the problem was modeled as a facility location one<sup>137</sup> and it was proved that the solution of the median is the ideal location for the sink node(s).<sup>138</sup> Part of this work was included in a Ph.D. Thesis.<sup>139</sup>

Research efforts in this particular area continued by proposing an operation framework to increase network lifetime through a dues mode operation: finding the optimal position for the sink node and then exploit it for uniform energy consumption of the network nodes.<sup>140</sup>

### 3.7.4 Recharger Placement for Recharging Distance Minimization

A different approach is recharging the nodes of a wireless sensor network and it was shown that this is once more a facility location problem.<sup>141</sup><sup>142</sup> An on-demand recharging policy was proposed and studied.<sup>143</sup> Even though it was a distributed one and based on local information, it was performing better than when compared against the existing ones in the literature that are based on global information. Part of this work was included in a Ph.D. Thesis.<sup>144</sup>

### 3.7.5 The Common Facility Location Problem for Sink and Recharger

A mobile recharger that operates on a wireless sensor network aims to keep the average network energy consumption and the distance covered as low as possible. As previously mentioned, the distance covered is minimized when the base of the mobile recharger is located according to the solution of a median problem. In contrast, the average energy consumption is minimized according to the solution of a different median problem. After a detailed study of the first problem, it was shown that its solution depends on the traffic load and topological characteristics. Moreover, it seems that, under certain conditions, the solution to both problems is the same. These analytical results motivate introducing a new recharging policy, simple to implement and based on local information. The simulation results confirm the analytical findings, showing that the solutions of both median problems are identical under certain conditions in a wireless sensor network environment. In addition, the proposed recharge policy is evaluated concerning a well-known policy that utilizes universal knowledge, proving its advantage in extending the life of the network. For both recharging policies, it appears that energy consumption and distance covered are minimized when the mobile recharger is initially working to resolve these median problems.<sup>145</sup>

## 3.8 Experimental IoT Environments and Applications

An important effort involved experimenting with Arduino and various types of low-cost devices. This includes a number of publications that confirm older theoretical approaches.<sup>146</sup><sup>147</sup>

### 3.8.1 Ionian University Demo Wireless Network

For further experiments, a wireless sensor network was created in the Ionian University Campus.<sup>148</sup> This is an extensive network of thirty nodes that allows experimentation in a real en-

environment as these buildings are historical features (solid walls, inner courtyards, etc.).<sup>149</sup> This environment is suitable for various types of experiments involving wireless networks.<sup>150 151 152 153</sup>

### 3.8.2 Vehicular Environments

Medium access control (MAC) is a challenging problem in vehicular environments due to a constantly changing topology due to vehicle's mobility and stringent delay requirements, especially for safety-related applications (e.g., for vehicular-to-vehicular communication). Consequently, topology-independent TDMA MAC policies that guarantee a number of successful transmissions per frame independently of the underlying topology, can be regarded as a suitable choice for the particular vehicular environment.<sup>154 155</sup> Apparently, investigating suitable TDMA MAC policies is a key research area in vehicular environments.<sup>156 157</sup> Another interesting aspect is offloading data in a smart city environment.<sup>158</sup>

### 3.8.3 UAV Environments

The recent technological evolution of drones along with the constantly growing maturity of its commercialization, has led to the emergence of novel drone-based applications within the field of wireless sensor networks for information collection purposes. In such settings, especially when deployed in outdoor environments with limited external control, energy consumption and robustness are challenging problems for the system's operation. Offloading a wireless sensor network is a first aspect to be studied.<sup>159</sup> Further research in the area revealed the importance of symmetry regarding the routes followed by a drone.<sup>160</sup> The case of a swarm of drones is also investigated.<sup>161</sup> Considering limited amount of energy for a particular environment where a budget is initially allowed, a backbone network can be constructed as the route of a drone.<sup>162</sup>

### 3.8.4 Smart City and Smart Tourism

An effort to study traffic within a city (smart city) was created to record the load with devices installed in cars and which were connected to a cloud computing network for further data

processing.<sup>163</sup><sup>164</sup><sup>165</sup> In the same way, experimentation took place to create low-cost infrastructure networks (backbone)<sup>166</sup> for applications in smart tourism.<sup>167</sup> The issue of the health of historic buildings was also studied through a relevant experimental application.<sup>168</sup><sup>169</sup> Theoretical approaches were also confirmed in this real environment.<sup>170</sup> Service issues for metropolitan networks from a different perspective were also studied.<sup>171</sup>

### 3.8.5 Smart Agriculture

Another application that was emphasized is smart agriculture and especially the cultivation in olive groves. A relevant architecture was proposed and various experiments were performed on the use of cloud computing architectures.<sup>172</sup><sup>173</sup> In this way it appeared that it is possible to optimize production. Another interesting application is the monitoring of areas to avoid fires.<sup>174</sup>

## 3.9 Various Research Topics (Security, Design, Social Networks, Education)

Various research topics have been studied such as privacy and security issues,<sup>175</sup> modeling a network of human relations as a time-varying graph<sup>176</sup> and privacy protection in peer-to-peer networks.<sup>177</sup> Another effort is to employ small robotics to improve teaching<sup>178</sup> as a result from a summer school.<sup>179</sup> The study effort for the development of a low-cost sensor network for the monitoring of pollution in the Ionian Sea was also considered.<sup>180</sup>

## 4 Additional Research Activities

The following is a list of various additional research activities of Prof. K. Oikonomou and are summarized as follows:

- 4.1 Synopsis of Research Interests
- 4.2 List of Selected Publications
- 4.3 Best Paper Awards
- 4.4 Selected Collaborations (Number of Publications: 34)
  - 4.4.1 KAUST / University of Quebec (INRS, Montreal), 2011-today
  - 4.4.2 University of Glasgow, 2011-2014
  - 4.4.3 Boston University, 2007-2014
- 4.5 Ph.D. Supervision
  - 4.5.1 Graduates (7)
  - 4.5.2 Ph.D. Students (3)
  - 4.5.3 Member of Ph.D. Advisory/Examination Committees (10)
- 4.6 Editorials
  - 4.6.1 Journals (6)
  - 4.6.2 Conference Proceedings (3)
- 4.7 Main Scientific Talks (6)
- 4.8 Reviews
- 4.9 Conference Organization (9)

### 4.1 Synopsis of Research Interests

Study and analysis of issues related to the placement of services in dynamic large-scale network environments. Study and analysis of issues related to information dissemination in large unstructured environments. Complexity and scalability issues in modern network environments. Social networking issues, modeling, analysis and study. Study and development of media access protocols and routing protocols in ad hoc and mesh networks. Energy consumption analysis in wireless sensor networks. Use of algebraic graph theory techniques to model the behavior of wireless networks. Performance issues in multimedia networks to support big data multimedia applications. Synchronization issues in wireless sensor networks. Cloud gaming issues. Service placement issues in cloud computing environments.

### 4.2 List of Selected Publications

The following is a list of selected publications that have been published in major conferences and peer-reviewed journals.

### 4.3 Best Paper Awards

2021 Best Paper Award from 26th IEEE Symposium on Computers and Communications (ISCC 2021) for paper:

Athanasios Tsipis and Konstantinos Oikonomou. “Player Assignment in MEC Gaming for Social Interactivity and Server Provisioning Optimization”. In: *26th IEEE Symposium on Computers and Communications (ISCC 2021)* (Athens, Greece). Sept. 2021

2005 Best Paper Award from Proceedings of the 38th Annual Hawaii International Conference on System Sciences (HICSS 2005) for paper:

Konstantinos Oikonomou and Ioannis Stavrakakis. “Power Efficiency Analysis for Topology-Unaware TDMA MAC Policies in Ad-Hoc Networks”. In: *Proceedings of the 38th Annual Hawaii International Conference on System Sciences (HICSS 2005)* (Big Island, Hawaii). Jan. 2005, 287b–287b

### 4.4 Selected Collaborations (Number of Publications: 34)

The following are the most essential international research-oriented collaborations as well as the corresponding publications.

#### 4.4.1 KAUST / University of Quebec (INRS, Montreal), 2011-today, Prof. Sonia Aïssa

Georgios Tsoumanis, Konstantinos Oikonomou, Sonia Aïssa, and Ioannis Stavrakakis. “Energy and Distance Optimization in Rechargeable Wireless Sensor Networks”. In: *IEEE Transactions on Green Communications and Networking* (2020), pp. 1–1.

George Koufoudakis, Konstantinos Oikonomou, Sonia Aïssa, and Ioannis Stavrakakis. “Analysis of Spectral Properties for Efficient Coverage Under Probabilistic Flooding”. In: *2018 IEEE 19th International Symposium on A World of Wireless, Mobile and Multimedia Networks (WoWMoM) (IEEE WoWMoM 2018)*. Chania, Crete, Greece, June 2018.

George Koufoudakis, Konstantinos Oikonomou, Konstantinos Giannakis, and Sonia Aïssa. “Probabilistic Flooding Coverage Analysis for Efficient Information Dissemination in Wireless Networks”. In: *Computer Networks* 140 (2018), pp. 51–61.

Konstantinos Skiadopoulos, Konstantinos Giannakis, Konstantinos Oikonomou, Ioannis Stavrakakis, and Sonia Aïssa. “Distributed Construction of d-Hop Connected Dominating Sets for Wireless Sensor Networks”. In: *2018 IEEE Global Communications Conference (GLOBECOM)*. Dec. 2018, pp. 1–7.

Georgios Tsoumanis, Konstantinos Oikonomou, Sonia Aïssa, and Ioannis Stavrakakis. “A Recharging Distance Analysis for Wireless Sensor Networks”. In: *Ad Hoc Networks* 75-76 (2018), pp. 80–86.

— “Performance Evaluation of a Proposed On-Demand Recharging Policy in Wireless Sensor Networks”. In: *2018 IEEE 19th International Symposium on “A World of Wireless, Mobile and Multimedia Networks” (WoWMoM) (IEEE WoWMoM 2018)*. Chania, Crete, Greece, June 2018.

- Georgios Tsoumanis, Konstantinos Oikonomou, Georgios Koufoudakis, and Sonia Aïssa. “Energy-Efficient Sink Placement in Wireless Sensor Networks”. In: *Computer Networks* 141 (2018), pp. 166–178.
- Georgios Tsoumanis, Konstantinos Oikonomou, Sonia Aïssa, and Ioannis Stavrakakis. “Recharging Vehicle Distance Minimization in Wireless Sensor Networks”. In: *BalkanCom 2017, First International Balkan Conference on Communications and Networking, Tirana, Albania* (Tirana, Albania). June 2017.

#### 4.4.3 Boston University, 2007-2014, Prof. Azer Bestavros, Prof. George Smaragdakis

- Georgios Smaragdakis, Nikolaos Laoutaris, Konstantinos Oikonomou, Ioannis Stavrakakis, and Azer Bestavros. “Distributed Server Migration for Scalable Internet Service Deployment”. In: *IEEE/ACM Transactions on Networking* 22.3 (June 2014), pp. 917–930.
- Nikolaos Laoutaris, Georgios Smaragdakis, Konstantinos Oikonomou, Ioannis Stavrakakis, and Azer Bestavros. “Distributed Placement of Service Facilities in Large-Scale Networks”. In: *IEEE INFOCOM 2007 - 26th IEEE International Conference on Computer Communications* (Barcelona, Spain). May 2007, pp. 2144–2152.

### 4.5 Ph.D. Supervision

He has supervised 7 completed doctoral dissertations and is currently at the Ionian University under the direct supervision of 3 Ph.D. candidates. He has also participated as an ordinary member in 10 three-member advisory committees and seven-member examination committees of doctoral dissertations.

### 4.5.1 Graduates (7)

So far, 7 doctoral dissertations have been completed under his supervision. These study issues are related to the placement of services in cloud network environments,<sup>181</sup> routes suitable for large-scale virtual world environments,<sup>182</sup> energy efficiency in sensor networks,<sup>183</sup> information dissemination by analysis of algebraic graph theory,<sup>184</sup> energy consumption and routing in wireless sensor networks,<sup>185</sup> information dissemination employing random walkers,<sup>186</sup> and cloud gaming.<sup>187</sup>

Athanasios Tsipis. “Network Resource Optimization in Cloud Computing Environments”. Ph.D. Thesis. Ionian University, Jan. 2021.

Apostolos Demertzis. “Energy-Aware Routing in Wireless Sensor Networks”. Ph.D. Thesis. Ionian University, June 2019.

George Koufoudakis. “Information Dissemination in Structured and Unstructured Networks”. Ph.D. Thesis. Ionian University, Feb. 2019.

Konstantinos Skiadopoulou. “Information Dissemination and Dominating Sets on Wireless Sensor Networks”. Text in greek. Ph.D. Thesis. Ionian University, Dec. 2019.

Georgios Tsoumanis. “Energy Consumption Optimization in Wireless Sensor Networks”. Ph.D. Thesis. Ionian University, Sept. 2018.

Eleni Kavvadia. “Virtual Machine Placement for Supporting Network Cloud Services”. Text in greek. Ph.D. Thesis. Ionian University, June 2017.

Vasileios Komianos. “Content Personalization Approaches in Cultural Heritage (Real, Virtual and Mixed) Environments”. Ph.D. Thesis. Ionian University, Nov. 2017.

### 4.5.2 Ph.D. Students (3)

At the moment 3 doctoral dissertations are in progress under the supervision of Prof. K. Oikonomou, which are the following:

Sofia Fanarioti. “Synchronization of Measurements in Wireless Sensor Networks”. Ph.D. Candidate. Ionian University, 2014.

Konstantina Maidatsi. “Exploiting the Internet of Things in STEM Education: Interconnected Devices and Environmental Education”. Ph.D. Candidate. Ionian University, 2020.

Vasileios Dragonas. “Medium Access Policies for Vehicular Networks”. Ph.D. Candidate. Ionian University, 2017.

### 4.5.3 Member of Ph.D. Advisory/Examination Committees (10)

He has also contributed as a member of Ph.D. Advisory and Examination Committees, without supervising, in the following successfully completed doctoral dissertations.

Akrivi Krouska. “A Novel Social Network Incorporating Intelligent Techniques for Personalized Collaborative Learning in Adult Education”. Supervisor: Prof. Maria Virvou. Ph.D. Thesis. University of Piraeus, 2019.

## 4.6 Editorials

There is an ongoing editing project with the following being the most important.

### 4.6.1 Journals (6)

Since January 2019 Prof. K. Oikonomou is a Member of the Editorial Board of the Computer Networks journal (Elsevier) and the Journal on Future and Evolving Technologies of the International Telecommunication Union (ITU) in 2020. He has also taken on the role of Guest Editor for various magazines. The full list is as follows:

- [Journal on Future and Evolving Technologies-ITU]. *Guest Editor of Special Issue: Emerging Trends and Applications in Future Communication Networks*. 2022.
- [Computer Networks-Elsevier]. *Member of the Editorial Board*. 2019-today.
- [Journal on Future and Evolving Technologies-ITU]. *Member of the Editorial Board*. 2020-today.
- [Future Internet-MDPI]. *Guest Editor of Special Issue: Network Cost Reduction in Cloud/Fog Computing Environments*. 2019-2020.
- [Sensors-MDPI]. *Guest Editor of Special Issue: Lifetime Extension Framework for Wireless Sensor Networks*. 2021-2022.
- [Technologies-MDPI]. *Guest Editor of Special Issue: Networking, Computing and Immersive Technologies for Smart Environments*. 2020-2021.

### 4.6.2 Conference Proceedings (3)

In the context of conferences in which Prof. K. Oikonomou had the role of organizer, the following 3 volumes have been published, which essentially include the minutes of the conferences.

Maria Virvou, Fumihiko Kumeno, and Konstantinos Oikonomou. *Knowledge-Based Software Engineering: 2018 - 2019*. Springer, 2018.

Timos Sellis and Konstantinos Oikonomou. *Algorithmic Aspects of Cloud Computing*. Springer, 2017.

Andrea Passarella and Konstantinos Oikonomou. *Special Section on Autonomic and Opportunistic Communications*. Elsevier, 2010.

#### 4.7 Main Scientific Talks (6)

He has been invited and has given scientific lectures of which the 6 most important are the following:

[Facility Location in Modern Networking Environments: Theory and Applications]. 8 March 2018, Sabanci University, Istanbul. *Invited talk hosted by Prof. Ozgur Gurbuz*. Mar. 2018.

[Virtual Worlds, Cultural Content and Infrastructures]. 1-2 July 2016, Syros, Greece. *Invited talk hosted by the General Secretariat of Digital Strategy*. July 2016.

[The S.M.ART.BUIL.T. Wireless Network: Going Through a Novel Architecture]. 1-2 July 2013, Corfu, Greece. *Invited talk hosted by the 2nd International Workshop on Structural Monitoring*. July 2013.

[Advanced Structural Monitoring through Wireless Sensor Technologies]. 30 November 2012, Bari, Italy. *Invited talk hosted by the International Workshop on Structural Monitoring*. Nov. 2012.

[Green Ethos in ICT]. 17 May 2010, Athens, Greece. *Invited talk hosted by the General Secretaries of Green ICT*. May 2010.

[Green ICT]. 14 December 2008, Athens, Greece. *Invited talk hosted by the Technical Chamber of Greece*. Dec. 2008.

#### 4.8 Reviews

He has reviewed a large number of research articles, the most important of which concern IEEE Infocom, IEEE Journal on Selected Areas in Communications, IEEE Transactions on Parallel and Distributed Systems, IEEE Transactions on Wireless Communications, IEEE Transactions on Vehicular Technology, IEEE Communications Magazine, IEEE Sensors Journal, IEEE Communications Letters, Computer Network (Elsevier), Ad Hoc Networks (Elsevier), Computer Communications (Elsevier), Pervasive and Mobile Computing (Elsevier) and many others (e.g., WoWMoM, NETWORKING, AOC, MedHocNet, IPDPS, WONS, WiOpt, QoFIS, ICT, IST M&CS, PWC, ICC, ICICTE, AICCSA, AINA, GCWC, BalkanCom, IISA, SEEDA).

#### 4.9 Conference Organization (9)

Has organized the following 9 conferences with the following roles:

BalkanCom 2021. [4th International Balkan Conference on Communications and Networking, Podgorica, Montenegro, 6-8 June 2018]. <http://www.balkancom.info/2021/>. *Role: TPC co-Chair*. Sept. 2021.

BalkanCom 2018. [2nd International Balkan Conference on Communications and Networking, Podgorica, Montenegro, 6-8 June 2018]. <http://www.balkancom.info/2018/>. *Role: Publicity co-Chair*. June 2018.

JCKBSE 2018. [12th Joint Conference on Knowledge-Based Software Engineering, Corfu, Greece, 27-30 August 2018]. <http://jckbse2018.unipi.gr>. *Role: Program co-Chair*. Aug. 2018.

- Algocloud 2016. [2nd International Workshop on Algorithmic Aspects of Cloud Computing, Aarhus, Denmark, 22 August 2016 ]. <http://conferences.au.dk/algo16/algocloud>. *Role: Workshop Program co-Chair*. Aug. 2016.
- IISA 2015. [6th Int. Conference on Information, Intelligence, Systems and Applications, Corfu, Greece, 6-8 July 2015]. <http://iisa2015.unipi.gr>. *Role: Special Session CNEA co-Chair*. July 2015.
- ISCC 2011. [IEEE Symposium on Computers and Communications, Corfu, Greece, 28 June - 1 July 2011]. <http://www.ieee-iscc.org/2011>. *Role: Local Arrangements co-Chair*. June 2011.
- AOC 2010. [IEEE WoWMoM Workshop on Autonomic and Opportunistic Communications, Montreal, Canada, 14 June 2010]. <http://cnd.iit.cnr.it/aoc2010/index.html>. *Role: Workshop co-Chair*. June 2010.
- AOC 2009. [IEEE WoWMoM Workshop on Autonomic and Opportunistic Communications, Kos, Greece, 15 June 2009]. <http://cnd.iit.cnr.it/aoc2009/index.html>. *Role: Workshop co-Chair*. June 2009.
- MedHocNet 2007. [Mediterranean Ad Hoc Networking Workshop, Corfu, Greece, 12-15 June 2007]. <http://di.ionio.gr/medhocnet07/>. *Role: Local Arrangements co-Chair*. June 2007.

## 5 Research and Development Programmes

Any involvement with research and development programs is about both the participation in the project team and the preparation of funding proposals. Moreover, participation in committees that plan future funding is also important.

### 5.1 Participation in Funded Research and Development Projects

He has participated in the research and development programs mentioned below, from research and development engineer to scientific director. In the context of these, several technical reports were prepared to support the requirements of the works (requirements, specifications, design documents) and scientific works (publications). In addition, several systems were developed (either in the form of a prototype system or in the form of source code) to demonstrate the results of the respective research projects. In most cases, Prof. K. Oikonomou was the scientific director for these deliverables and the annual evaluations (project reviews) of the managing authorities.

#### 5.1.1 Main Funded Projects (9)

Regarding the main 9 research and development projects in which he participates/has participated, he has dealt with the issue of the quality of services in wireless local area networks,<sup>188</sup> and the issue of supporting the dual operation of a wireless local area network.<sup>189</sup> He then addressed the issue of creating a new network protocol stack architecture to create a new standalone autonomous example.<sup>190</sup> He was also involved in a project to upgrade digital Ionian University services<sup>191</sup> as well as trying to solve synchronization issues in wireless network environments for

<sup>188</sup>HARMONICS. [(5th Framework) IST-1999-11719]. *Role: Workpackage co-ordinator on behalf of Intracom S.A.*. 2000-2003.

<sup>189</sup>BROADWAY. [(6th Framework) IST-2001-32686]. *Role: Workpackage co-ordinator on behalf of Intracom S.A.*. 2002-2005.

<sup>190</sup>Autonomic Network Architecture (ANA), see n. 8, p. 3.

<sup>191</sup>Ionian University Digital Planning Services. [ESPA 2007-2013]. *Role: Co-ordinator on behalf of the Ionian University*. 2010-2015.

historic buildings.<sup>192</sup>

An important part of his development effort includes the work of the virtual worlds for which it was required to model about 160 buildings in the Ionian Islands.<sup>193</sup> This was followed by the work of the virtual representation of Corfu and its culture.<sup>194</sup> The issue of synchronization in sensor networks returns now from the point of view of crop support.<sup>195</sup> Education issues through video conferencing platforms have also been studied and various actions have been implemented in the framework of the cross-border project.<sup>196</sup>

The list of these 9 projects is summarized as follows:

v-Corfu. [ESPA 2014-2020]. *Role: Co-ordinator on behalf of the Ionian University.* 2019-2022.

TELEICCE. [Interreg Greece-Italy]. *Role: Co-ordinator on behalf of the Ionian University.* 2018-2020.

OLI-Net. [ESPA 2014-2020]. *Role: Co-ordinator on behalf of the Ionian University.* 2017-2020.

Ionian Islands Virtual World. [ESPA 2007-2013]. *Role: Co-ordinator on behalf of the Ionian University.* 2012-2015.

S.M.ART.BUIL.T. [Interreg Greece-Italy]. *Role: Technical co-ordinator on behalf of the Ionian University.* 2012-2015.

BROADWAY. [(6th Framework) IST-2001-32686]. *Role: Workpackage co-ordinator on behalf of Intracom S.A.* 2002-2005.

Ionian University Digital Planning Services. [ESPA 2007-2013]. *Role: Co-ordinator on behalf of the Ionian University.* 2010-2015.

Autonomic Network Architecture (ANA). [(FET) IST-27489]. *Role: Post-doc researcher on behalf of the National & Kapodistrian University of Athens.* 2005-2010.

HARMONICS. [(5th Framework) IST-1999-11719]. *Role: Workpackage co-ordinator on behalf of Intracom S.A.* 2000-2003.

During his professional involvement in Intracom SA, he was involved with various roles in several research and development projects, such as CASPIAN (2/2000 - 2/2001, researcher responsible for implementation of a virtual device driver for the Linux Kernel that allows the direct loading of network protocols in the kernel of the system), BROADBAND IP (2/2000 - 2/2002, project coordinator for the creation of a system that simulates the existence of a satellite network and the implementation of the necessary modifications for the efficient operation of TCP in satellite networks), ADAMAS (4/2002 - 4/2003, researcher responsible for the interconnection of protocols with the operating system kernel of the original platform), ROMANTIK (2/2004 - 1/2005, project coordinator the expansion of the coverage area of a network with multi-wave techniques), E-NEXT (1/2004 - 1/2005, a researcher in the context of the effort to build a scientific network under the auspices of the 6<sup>th</sup> Framework.

### 5.1.2 Publications per Funded Project

The following is the list of publications that are directly related to any of the previously mentioned projects. This is important to highlight research results especially since funded projects may not always have a research orientation.

## 5.2 Project Proposal Preparation

In addition to participating in various projects, Prof. K. Oikonomou has written and submitted various proposals for funding which have either been successful or not. In particular, it has submitted proposals for funding at the European level (STREP, FET), having set up the research team (consortium), and coordinated them in drafting the proposal. He has also submitted proposals for cross-border cooperation in either Greece-Italy and Greece-Albania thematic cooperation, in Greek Ministry announcements (e.g., Invitation 184, Research-Innovate), in Digital Convergence, ELIDEK, GSRT as well as in announcements of the Ionian Islands Region (ESPA 2007-2013 and ESPA 2014-2020).

## 6 Teaching

His teaching work started in the spring semester of 2006. It is uninterrupted in courses related to Computer Networks in undergraduate and postgraduate studies while he has supervised respective 84 undergraduate and postgraduate theses.

<sup>203</sup>HARMONICS. [(5th Framework) IST-1999-11719]. *Role: Workpackage co-ordinator on behalf of Intracom S.A.*. 2000-2003.

## 6.1 Courses

In the Department of Informatics of the Ionian University, he teaches courses on telecommunications and networks in the undergraduate course (Information Theory, Networks I, Networks II, Distributed Network-Centered Systems) and in the postgraduate course (Networks, Networks, Communication Networks, and Mobile Communications, Advanced Data Network Themes, Network Performance Modeling and Analysis). He also undertook courses related to operating systems and virtual worlds in the context of serving the needs of the Department while also serving the needs of other Departments in Informatics (e.g., the respective Informatics courses of the Department of Foreign Languages, Translation and Interpretation).

## 6.2 Undergraduate and Postgraduate Supervision (84 )

He has supervised a total of 84 theses, of which 49 in the postgraduate and 35 in the undergraduate course.

## 6.3 Summer Schools (4)

He has participated/organized 4 summer schools:

[Ionian Islands Virtual World: Monuments and Locations]. 7-22 August 2017, Corfu, Greece. *Invited talk in the Greek Language and Culture Summer School organized by the Department of History, Ionian University.* Aug. 2017.

[Principles of Informatics - Applications in Robotics]. 19-23 June 2017, Corfu, Greece. *Organizer of Summer School Principles of Informatics - Applications in Robotics organized by the Department of Informatics, Ionian University.* June 2017.

[Virtual Worlds and Promotion of Cultural Heritage]. 6-12 July 2017, Corfu, Greece. *Invited talk in the Summer School Digital Technologies & Innovation in Tourism Entrepreneurship organized by the Department of Informatics, Ionian University.* July 2017.

[Ionian Islands Virtual World: Monuments and Locations]. 1-31 August 2018, Corfu, Greece. *Invited talk in the Greek Language and Culture Summer School organized by the Department of History, Ionian University.* Aug. 2018.

## 7 Administrative Work

The administrative work he has undertaken during his tenure at the Department of Informatics of the Ionian University since his first appointment as a faculty member in 2007, is pervasive. Throughout this period, there is intense activity and participation in various committees such as the undergraduate program committee, institute committees (e.g., Informatics and Communications Committee), competition committees, drafting regulations in the Department (postgraduate program, dissertations, event for doctoral candidates, etc.), organization of procedures, etc. Furthermore, from May 2018 until May 2020, he was the Director (one term) of the Postgraduate Studies Program entitled “Research Directions in Informatics” of the Department of Informatics. He remains a member of the boarding committee of the specific postgraduate.

Prof. K. Oikonomou, since becoming Associate Professor in 2017 undertook further and more extensive official duties. In particular, from May 2017 until October of the same year, he was President of the Department of Informatics, while from December 2017 to August 2021 he was Dean of the School of Information Science and Informatics of the Ionian University. The specific position in which he serves has many administrative duties.

## 8 List of Publications (123)

Prof. K. Oikonomou’s scientific publications can be categorized into those published in crisis journals and conferences and other publications. He was either invited to submit a paper or took place as part of a project or edited volumes.

### 8.1 Referred Publications(115)

He has authored 115 referred publications, of which 41 in journals and 74 conferences. His work has received until now 972 references with h-index 16, g-index 26 and i10-index 26.<sup>204</sup>

## 8.2 Various Publications and Editions (8)

Prof. K. Oikonomou has published 8 works that have not gone through a review process. These are mostly research works that he was invited to submit or about a research project, the editor of a volume, or a chapter in a book.

### 8.2.1 Journals

- George Koufoudakis, Nikos Skiadopoulos, Emmanouel Magkos, and Konstantinos Oikonomou. “Synchronization Issues in an Innovative Wireless Sensor Network Architecture Monitoring Ambient Vibrations in Historical Buildings”. In: *Key Engineering Materials* 628 (2014).
- Konstantinos Oikonomou, George Koufoudakis, Eleni Kavvadia, and Vassilis Chrissikopoulos. “A Wireless Sensor Network Innovative Architecture for Ambient Vibrations Structural Monitoring”. In: *Key Engineering Materials* 628 (2014).

### 8.2.2 Conferences

Georgios Tsoumanis, George Koufoudakis, Konstantinos Oikonomou, Markos Avlonits, and Nikos Varotsis. “A Low-Cost Surface Wireless Sensor Network for Pollution Monitoring in the Ionian Sea”. In: *12th Panhellenic Symposium of Oceanography & Fisheries* (Corfu, Greece). Abstract. May 2018.

Konstantinos Skiadopoulos and Konstantinos Oikonomou. “Probabilistic Information Dissemination Aspects in Wireless Sensor Networks Located in Historical Buildings”. In: *2014 S.M.ART.BUIL.T International Conference* (Bari, Italy). Mar. 2014.

### 8.2.3 Book Editing

Maria Virvou, Fumihiro Kumeno, and Konstantinos Oikonomou. *Knowledge-Based Software Engineering: 2018 - 2019*. Springer, 2018.

Timos Sellis and Konstantinos Oikonomou. *Algorithmic Aspects of Cloud Computing*. Springer, 2017.

Andrea Passarella and Konstantinos Oikonomou. *Special Section on Autonomic and Opportunistic Communications*. Elsevier, 2010.

### 8.2.4 Book Chapters

Apostolos Demertzis and Konstantinos Oikonomou. “Braided Routing Technique to Balance Traffic Load in Wireless Sensor Networks”. In: *Sensor Technology: Concepts, Methodologies, Tools, and Applications*. IGI Global, Mar. 2020. Chap. 40, pp. 837–855.
